

### In The Abstract

**Amend the Abstract as follows:**

~~Disclosed is an anode-supported flat tubular solid oxide fuel cell stack, which includes an anode-supported tube having semi-cylinder parts and plate parts, thereby securing a combined structure of a tube type and a plate type anode-supported body, and a method of fabricating the same. The~~ An anode-supported flat-tubular solid oxide fuel cell stack includes a plurality of fuel cells and a plurality of connector plates. Each of the fuel cells includes a supported tube having ~~the~~ semi-cylinder parts and plate parts, a connector coated on an upper plate of the supported tube as a way to be positioned at the center of the upper plate, an electrolyte layer partly coated on an external surface of the supported tube except for a portion of the supported tube coming into contact with the connector, and an air electrode coated on an external surface of the electrolyte layer. ~~Additionally, each~~ Each of the connector plates includes a lower connector plate, ~~one or more~~ middle connector plates, and an upper connector plate. ~~In this regard, a~~ A plurality of gas channels are formed on the middle and lower connector plates. ~~Therefore, the~~ The anode-supported flat-tubular solid oxide fuel cell stack has ~~advantages of~~ a large capacity, ~~an~~ improved power density, ~~mass production,~~ and reduced production costs.
